System Administrators' Manual

1. Overview

This documentation will enable the system administrator to install and manage the system with ease.

2. Database Installation

The system administrator should first install MySQL 5 server.

3. Web Server Installation

The system administrator should install the Tomcat application server with or without the Apache Web server.

4. OpenMPIS Installation

The system administrator can now build and deploy OpenMPIS.

5. Security Audit

The system administrator should ensure system security. He should perform penetration tests, SQL injection tests and cross-site scripting tests regularly. He should also read the system logs from time to time.

6. Database Backup

The system administrator should also automate the back up of the database.
